

NEVER LOSE TRACK OF YOUR GAGES AGAIN

GAGETRAK CRIB

GAGetrak Crib is a comprehensive crib management tool that allows you to track every issuance, return, calibration and repair of every gage. Crib connects to your GAGetrak Pro database and is a perfect solution for a gage or tool crib operator or for any other staff member who needs to transfer gages, when a full copy of GAGetrak Pro is not necessary.

The extensive crib management capability of GAGetrak Crib is already part of GAGetrak Pro, but for staff members who do not need full access to GAGetrak Pro, opting for a separate license of Crib as a stand-alone product is the perfect, low-cost solution. Crib connects to your GAGetrak Pro database and allows you to track gages through their entire life cycle, including product interactions.

With GAGetrak Crib, you can track every issuance, return, calibration and repair of every gage. This is particularly useful in a gage crib, where gages and inspection equipment are checked out and then returned for storage or to allow any staff out on the floor to transfer gages. By tracking this information, you'll identify which gages your company uses the most and who uses those gages. You'll also be able to locate any gage at any time.

Transfers in Crib can follow two-step transactional or single-step routing models; transfer a single gage or multiple gages in a batch and apply configurable routing rules to automatically update locations, status or even to identify gages that are not eligible for transfer or able to be used on specific products.

Instructions
To create a new transfer or service request from a template, select the template. Otherwise, select a rule.

The extensive product management tools in Crib provide details on product interaction with your gage inventory by allowing you to configure time-saving transfer templates, transfer rules and service letters.

- Use transfer templates to define key characteristics of your products and easily manage your gage requirements and capabilities.
- Define transfer rules to ensure that gages can only be transferred to products or jobs when they meet specific measurement capability requirements.
- Review product and gage transfer history for corrective actions or product recalls.
- Use the three pre-defined letters in the Crib for service requests to outside vendors or you can create your own letters as needed and include them in service requests or transfers.
- Use Service Requests to transfer gages to commercial calibration providers or customers, including instructions, notes and reminders.
